Proteins of this kind have been shown to be effective at preventing blood clotting without causing excessive bleeding. The protein can be used in blood collection tubes to aid the isolation of plasma from the blood, to prevent thrombosis which may be linked to the rupture of an atherosclerotic plaque, acute myocardial infaction, angina, thrombolytic therapy, percutaneous transluminal coronary angioplasty, disseminated intravascular coaqulopathy, infection, cancer and septic shock, and to produce antibodies. In the latter instance, the antibodies can be raised in order to detect infection by nematodes (the coding sequence can also be used for this) or as diagnostic tests. The protein can also be used as a vaccine against

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                         activity, isolated from nemacodes, are useful to inhibit blood cocapilation. The proteins can be added to blood collection tubes defining the collection of mammalian plasma. They are also useful to prevent or inhibit thrombosis, and may be given alone or in combination with other therapeutic or in vivo diagnostic agents. The proteins can serve as immunogens to raise antibodies for use in the diagnosis and identification of NAP concil levels in biological fluids, e.g. to detect mammalian infection with a parasitic worm. They can also be used as immunogens in prophylactic and therapeutic vaccines against parasitic worm infection. The proteins may double the clotting time of human plasma in prothrombin time assays when present at 10-50 mMol, and double the clotting time of human c plasma in activated partial thrombin time assays when present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The proteins pref. have 2 NAP domains and specifically inhibit the catalytic activity of the factor VIIa/TF complex in the presence of factor Xa or a catalytically inactive factor Xa deriv., do not specifically inhibit the activation of factor VIIa in the absence of TF and do not specifically inhibit prothrombinase.

Proteins given in AAR91720-R91732 are preferred subsequences
                                                                               Proteins with anticoagulant and/or serine protease inhibitory activity - isolated from nematodes and useful to inhibit blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nematode extracted anticoagulant protein; NAP; anticoagulant; serine protease inhibitor; NAP domain; factor VIIa/TF.

```
The present sequence represents a nematode extracted anticoagulant protein (NAP) fragment. The protein has activity as an anticoagulant and/or serine protease inhibitor. The protein contains at least one and/or serine protease inhibitory activity for factor VIIa/TP.

The specification describes a method for screening an isolated protein at least one domain for factor VIIa/TP selective inhibitory activity.

The method comprises determining the time to clotting effected by a concentration of the isolated protein in an ex vivo prothrombin time (PT) assay and an ex vivo activated partial thrombollastin time (aPTT) assay; calculating prolongation of clotting effected by the isolated protein in each of the PT and aPTT assay, with respect to a baseline clotting value for each assay, where prolongation of clotting is calculated as fold elevation of clotting time relative to a baseline clotting value, where a doubling of clotting time relative to a baseline clotting value, where a doubling of clotting time is deemed a two-fold elevation; and calculating a PT to aPTT prolongation ratio, where a cravit at least one is indicative of factor VIIa/TF inhibitory activity.

The method is useful for determining if a protein has factor VIIa/TF inhibitory activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nematode-extracted anticoagulant protein; NAP domain; blood clotting;

                                                                                                                                                                     The present sequence is a fragment of the NAP domain (see AAB15347), which is found in all nematode-extracted anticoagulant proteins (NAPs). Proteins of this kind have been shown to be effective at preventing blood clotting without causing excessive bleeding. They can be used in blood collection tubes to aid the isolation of plasma from the blood, to prevent thrombosis which may be linked to the rupture of an atherosclerotic plaque, acute myocardial infarction, angina, thrombolytic therapy, perutaneous transluminal coronary angioplasty, disseminated intravascular coagulopathy, infection, cancer and septic shock, and to produce antibodies. In the latter instance, the antibodies can also be used for this) or as diagnostic tests. The proteins can also be used for this) or as diagnostic tests. The proteins can also be used as vaccines against nematode parasites.
                                                                                                                                                                                                                                                                                                                                                                        Gaps

Proteins with anticoagulant and/or serine protease inhibitory activity, isolated from nematodes, are useful to inhibit blood cogulation. The proteins can be added to blood collection tubes defining the collection of mammalian plasma. They are also useful to prevent or inhibit thrombosis, and may be given alone or in combination with other therapeutic or in vivo diagnostic agents. The proteins can serve as immunogens to raise antibodies for use in the diagnosis and identification of NAP conc. levels in biological fluids, e.g. to detect mammalian infection with a parasitic worm. They can also be used as immunogens in prophylactic and therapeutic vaccines against parasitic worm infection. The proteins may double the clotting time of human plasma in prothrombin time assays when present at 10-50 nMol, and double the clotting time of human plasma in activated partial thrombin time assays when present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                   Lauwereys MJ, Laroche YR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The anticoagulant proteins are pref. derived from Ancylostoma caninum, A. ceylanicum, A. duodenale, Necator americanus or Heligomosmoides polygyrus.

The proteins pref. have 2 NAP domains and specifically inhibit the catalytic activity of the factor VIIa/TF complex in the presence of factor Xa or a catalytically inactive factor Xa deriv. do not specifically inhibit the activation of factor VIIa in the absence of TF and on the specifically inhibit prothrombinase.

Proteins given in AAR91720-R91732 are preferred subsequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Proteins with anticoagulant and/or serine protease inhibitory activity - isolated from nematodes and useful to inhibit blood coagulation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nematode extracted anticoagulant protein; NAP; anticoagulant; serine protease inhibitor; NAP domain; factor VIIa/FF.

The present sequence is a fragment of the NAP domain (see AAB15347), which is found in all nematode-extracted anticoagulant proteins (NAPs). Proteins of this kind have been shown to be effective at preventing blood clotting without causing excessive bleeding. They can be used in blood collection tubes to aid the isolation of plasma from the blood, to prevent thrombosis which may be linked to the rupture of an archerosclerotic plaque, acute myocardial infarction, angina, thrombolytic therapy, percutaneous transluminal coronary angioplasty, disseminated intravascular coagulopathy, infection, cancer and septic shock, and to produce antibodies. In the latter instance, the antibodies can be raised in order to detect infection by nematodes (the coding sequences can also be used for this) or as disagnostic tests. The proteins can also be used sagainst nematode parasites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Stanssens PEH, Jespers LS, Gansemans YGJ, Moyle M; ssens JHL, LaRoche YR, Vlasuk GP;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a nematode extracted anticoagulant protein (NAP) fragment. The protein has activity as an anticoagulant and/or serine procease inhibitor. The protein contains at least one (NAP) damain which has selective inhibitory activity for factor VIIa/TE. The specification describes a method for screening an isolated protein at least one domain for factor VIIa/TE selective inhibitory activity. The method comprises determining the time to clotting effected by a concentration of the isolated protein in an ex vivo prothrombin time (PT) assay and an ex vivo activated partial thromboplastin time (aPTT) assay, calculating prolongation of clotting effected by the isolated protein in each of the PT and aPTT assay, with respect to a baseline clotting value for each assay, where prolongation of clotting is calculated as fold elevation of clotting time relative to a baseline clotting value, where a doubling of clotting time relative to a baseline clotting and calculating a PT to aPTT prolongation ratio, where a cratic at least one is indicative of factor VIIa/TF inhibitory activity. The method is useful for determining if a protein has factor VIIa/TF inhibitory activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

nematode-extracted anticognism in the proteins AcaNAP21, AcaNAP42 and AcaNAP46. Proteins of this kind have been shown to be effective at preventing blood clotting without causing excessive bleeding. The proteins can be used in blood collection tubes to aid the isolation of plasma from the blood, to prevent thrombosis which may be linked to the rupture of an atherosclerotic plaque, acute myocardial infarction, angina, thrombolytic therapy, percutaneous transluminal coronary angioplasty, disseminated intravascular coagulopathy, infection, cancer and septic shock, and to produce antibodies. In the latter instance, the antibodies can be raised in order to detect infection by nematodes (the coding sequence can also be used for this) or as diagnostic tests. The proteins can also be used as a vaccine against nematode parasites.
                                                                                                                                                                                                                                                                                               PEH, Jespers LS, Gansemans YGJ, Moyle M;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a nematode extracted anticoagulant protein has activity as an anticoagulant and/or scrine protein (NAP). The protein has activity as an anticoagulant and/or scrine proteins inhibitory activity for factor VIIa/TF. The specification as selective inhibitory activity for factor VIIa/TF. The specification describes a method for screening an isolated protein at least one domain for factor VIIa/TF selective inhibitory activity. The method comprises determining the time to clotting effected by a concentration of the isolated protein in an ex vivo prothrombin time (PT) assay and an ex vivo activated partial thromboplastin time (PT) assay; and an ex vivo activated partial thromboplastin time (apr) assay; alculating of clotting effected by the isolated protein in each of the PT and appra assay, where prolongation of clotting isolated protein in each of alevation of clotting time relative to a baseline clotting value, where a doubling of clotting time is deemed a two-fold elevation; and calculating a PT to appropriation ratio, where a ratio at least cone is indicative of factor VIIa/TF inhibitory activity. The method is useful for determining if a protein has factor VIIa/TF inhibitory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               protein (NAP). The protein has activity as an anticoagulant and/or serine protein (NAP). The protein has activity as an anticoagulant and/or serine protease inhibitory. The protein contains at least one NAP domain which has selective inhibitory activity for factor VIIa/TF. The specification for for factor VIIa/TF selective inhibitory activity. The method comprises cateraning the time to clotting effected by a concentration of the isolated protein in an ex vivo protrombin time (PT) assay and an ex vivo activated partial thromboplastin time (aPTT) assay; calculating prolongation of clotting effected by the isolated protein in each of the act assay, with respect to a baseline clotting value for each assay, where prolongation of clotting is calculated as fold elevation of clotting time relative to a baseline clotting value, where a doubling of clotting time relative to a baseline clotting value, where calculating a pT to apTT prolongation ratio, where a ratio at least one is indicative of factor VIIa/TF inhibitory activity. The method is useful for determining if a protein has factor VIIa/TF inhibitory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

protein (NAP). The protein has activity as an anticoagulant and/or serine protein challed to protein has activity as an anticoagulant and/or serine protein contains at least one NAP domain which can selective inhibitory activity for factor VIIa/TF. The specification describes a method for screening an isolated protein at least one domain for factor VIIa/TF. The specification of confirming the time to clotting effected by a concentration of the isolated protein in an ex vivo prothrombin time (PT) assay and an ex vivo activated partial thromboplastin time (aPTT) assay, and an ex vivo prolongation of clotting effected by the isolated protein in each of prolongation of clotting effected by the isolated protein in each of can assay, where prolongation of clotting is calculated as fold elevation of clotting time relative to a baseline clotting value, where a doubling of clotting time relative to a baseline clotting value, where calculating a PT to aPTT prolongation there a ratio at least cone is indicative of factor VIIa/TF inhibitory activity. The method is useful for determining if a protein has factor VIIa/TF inhibitory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Screening an isolated protein for Nematode-extracted Anticoagulant
Protein domains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            sequence represents a nematode extracted anticoagulant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          93.8%; Score 30; DB 20; Length 82;

The present sequence is the Ancyclostoma ceylanicum nematode-extracted anticoagulant protein AcaNAP4d2. Proteins of this kind have been shown to be effective at preventing blood clotting without causing excessive bleeding. The protein can be used in blood collection tubes to aid the isolation of plasma from the blood, to prevent thrombosis which may be linked to the rupture of an atherosclerotic plaque, acute myocardial infarction, angina, thrombolytic therapy, percutaneous transluminal coronary angioplasty, disseminated intravascular coagulopathy, infection, cancer and septic shock, and to produce antibodies in the latter instance, the antibodies can be raised in order to detect infection by nematodes or as diagnostic tests. The protein can also be used as a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is the Ancyclostoma ceylanicum nematode-extracted anticoagulant protein AceNAP4d2. Proteins of this kind have been shown to be effective at preventing blood clotting without causing excessive bleeding. The protein can be used in blood collection tubes to aid the isolation of plasma from the blood, to prevent thrombosis which may be linked to the rupture of an atherosclerotic plaque, acute myocardial infarction, angina, thrombolytic therapy, percutaneous transluminal coronary angioplasty, disseminated intravascular coagulopathy, infection, cancer and septic shock, and to produce antibodies. In the latter instance, the antibodies can be raised in order to detect infection by nematodes or as diagnostic tests. The protein can also be used as a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

                                                                                                                                                                                                                                                                                                         Š
                                      The present sequence represents a nematode extracted anticoagulant protein (MAP). The protein has activity as an anticoagulant and/or serine protein in the protein contains at least one NAP domain which has selective inhibitor. The protein contains at least one NAP domain which has selective inhibitory activity for factor VIIA/TF specification describes a method for screening an isolated protein at least one domain for factor VIIA/TF selective inhibitory activity. The method comprises determining the time to clotting an isolated protein at an ex vivo prothrombin time (PT) assay and an ex vivo activated partial thromboplastin time (aPT) assay, and an ex vivo prolongation of clotting effected by the isolated protein in each of the PT and aPTT assay, with respect to a baseline clotting value for each assay, where prolongation of clotting time relative to a baseline clotting value, where a doubling of clotting time relative to a baseline clotting value, where a calculating a PT to aPTT prolongation ratio, where a ratio at least one is indicative of factor VIIA/TF inhibitory activity. The method is useful for determining if a protein has factor VIIA/TF inhibitory
                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                Gaps

The present sequence represents a nematode extracted anticoagulant protein has activity as an anticoagulant and/or serine protein has activity as an anticoagulant and/or serine protease inhibitor. The protein contains at least one MAP domain which has selective inhibitory activity for factor VIIa/TF. The specification describes a method for screening an isolated protein at least one domain for factor VIIa/TF selective inhibitory activity. The method comprises determining the time to clotting effected by a concentration of the solated protein in an ex vivo prothrombin time (PT) assay and an ex vivo prothrombin time (PT) assay and an ex vivo prothrombin time (PT) assay and an ex vivo prolongation of clotting effected by the isolated protein in each of the PT and aPTT assay, with respect to a baseline clotting value for each assay, where prolongation of clotting is calculated as fold clevation of clotting time relative to a baseline clotting value, where a doubling of clotting time relative to a baseline clotting value, where calculating a PT to aPTT prolongation ratio, where a ratio at least one is indicative of factor VIIa/TF inhibitory activity. The method is useful for determining if a protein has factor VIIa/TF inhibitory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

The present sequence represents a nematode extracted anticoagulant protein (NAP). The protein has activity as an anticoagulant and/or serine protein (NAP). The protein contains at least one NAP domain which has selective inhibitory activity for factor VIIa/TF. The specification can selective inhibitory activity. The specification of for factor VIIa/TF selective inhibitory activity. The specification of for factor VIIa/TF selective inhibitory activity. The method comprises determining the time to clotting effected by a concentration of the isolated protein in an ex vivo prothrombin time (PT) assay and an ex vivo activated partial thromboplastin time (PT) assay and an ex vivo activated partial thromboplastin time (PT) assay, and ex vivo cativated partial thromboplastin time (PT) assay, and the vivo each assay, where prolongation of clotting is calculating of clotting time relative to a baseline clotting value, where a doubling of clotting time is deemed a two-fold elevation; and calculating a PT to aPTT prolongation ratio, where a ratio at least cone is indicative of factor VIIa/TF inhibitory activity. The method is useful for determining if a protein has factor VIIa/TF inhibitory

An alternative splicing modifies the C-terminal end of tryptophanyl-tRNA synthetase in murine embryonic stem cells.";
J. Mol. Biol. 242:599-603(1994).
-!-CATALYTIC ACTIVITY: ATP + L-tryptophan + tRNA(Trp) = AMP + diphosphate + L-tryptophanyl-tRNA(Trp).
-!-SUBUNIT: Homodimer (By similarity).
                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Name=1; Synonyms=Long;
IsoId=P32921-1; Sequence=Displayed;
Name=2; Synonyms=Short;
IsoId=P32921-2; Sequence=VSP 006313;
-!- TISSUB SPECIFICITY: Isoform 2 Is widely expressed, isoform 1 is found only in embryonic stem cells.
-!- SIMILARITY: Belongs to class-I aminoacyl-tRNA synthetase family.
-!- SIMILARITY: Contains 1 WHEP-TRS domain.
                                                                                                                                                                                                                                                                               01-OCT-1993 (Rel. 27, Created)

-!- FUNCTION: THIS IS A COPPER-CONTAINING OXIDASE THAT FUNCTIONS IN
THE PORMATION OF PIGMENTS SUCH AS MELANINS AND OTHER POLYPHENOLIC
COMPOUNDS: CATALYZES THE RATE-LIMITING CONVERSIONS OF TYROSINE TO
DOPA, DOPA TO DOPA-QUINONE AND POSSIBLY 5,6-DIHYDROXYINDOLE TO
INDOLE-5,6 QUINONE.
-!- CATALYTIC ACTIVITY: L-tyrosine + L-DOPA + O(2) = L-DOPA +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DOPAGUINONE + H(2)O.

COACTON: Binds 2 copper ions per subunit.

SUBCELLULAR LOCATION: Type I membrane protein. Melanosomal.

DISEASE: DEFECTS IN TYR RESULT IN VARIOUS FORMS OF ALBINISM.

HIMALAYAN STRAIN TYROSINASE IS TEMPERATURE-SENSITIVE.

SIMILARITY: BELONGS TO THE TYROSINASE FAMILY.

CAUTION: REF. 4 SEQUENCE WAS INCORRECT DUE TO A DELETION OF EXON 3.
